

Environmental Management Systems

(ISO 14001)

ETCI's innovative training workshops are highly interactive, and apply US and international best practice tools to the client's own problems and cases so that participants leave the training room with actual practice under their belts, not just theory.

Using our "Five Big Questions" format, we can help participants design a new EMS from the ground up, or focus on one or more components of a complete EMS.

Aspects of environmental management systems that we typically select from to cover in a workshop include:

- Evaluating the present situation
- Developing an appropriate environmental policy
- Identifying environmental aspects and impacts
- Creating procedures
- Creating training programs
- Involving the public
- Management review
- Preparing for audits
- Conducting internal audits
- Choosing certification – or not
- Creating goals
- Developing manuals
- Getting buy-in from managers and employees
- Budgeting a new – or ongoing – environmental management system
- Ensuring compliance with policies and procedures
- Periodic review
- Implementing an environmental management system
- Revising and updating an environmental management system
